"The existence of tumblers has made the anonymous use of darknet markets easier and the job of law enforcement harder. Peer-to-peer tumblers Peer-to-peer tumblers act as a place of meeting for bitcoin users, instead of taking bitcoins for mixing. Users arrange mixing by themselves. This model solves the problem of stealing, as there is no middleman. When it is completely formed, the exchange of bitcoins between the participants begins. Apart from mixing server, none of the participants can know the connection between the incoming and outgoing addresses of coins."

"While RIPEMD functions are less popular than SHA-1 and SHA-2, they are used, among others, in Bitcoin and other cryptocurrencies based on Bitcoin. History The original RIPEMD function was designed in the framework of the EU project RIPE (RACE Integrity Primitives Evaluation) in 1992. Its design was based on the MD4 hash function. In 1996, in response to security weaknesses found in the original RIPEMD, Hans Dobbertin, Antoon Bosselaers and Bart Preneel at the COSIC research group at the Katholieke Universiteit Leuven in Leuven, Belgium published four strengthened variants: RIPEMD-128, RIPEMD-160, RIPEMD-256, and RIPEMD-320. In August 2004, a collision was reported for the original RIPEMD. This does not apply to RIPEMD-160."
